

Clinical Observation of Dr. T. Peerayot, M.D.: Using MRET Activated Water as Additional Treatment (Explore Magazine, Vol.15, No.2, 2006 and Vol.14, No.6, 2005)

Dr. Trongkawad Peerayot, MD, Pension Officer, Ex-Director of AIDS Control Department, Bangkok Metropolis conducted clinical observations regarding the consumption of MRET Activated Water by patients suffering from AIDS/HIV and other diseases in 2004 – 2005. Dr. Peerayot's interest in studying MRET activated water was triggered when he saw how MRET activated water consumption affected his "near-death" mother (85 years old) at Songkran hospital in April 2004. The consumption of MRET activated water actually brought his mother back to life.

The most representative study was conducted on **38 AIDS patients** during July-August, 2005. All patients were consuming **1.5 liters** of MRET activated water per day as a complimentary treatment in addition to the prescribed Antiretroviral and Symptomatic medicine. During the course of clinical observation all 38 patients were tested on a regular basis for CD4 counts and required to submit weekly reports of their health conditions. Summarizing the observation results it is possible to indicate that in compliance with the studied gradations of AIDS patients the health conditions of 36 patients showed significant improvement and only 2 patients did not show improvement of their health condition.

At the end of the observation two patients were selected to undergo two tests at Bangkok Pathology Laboratories. One test was for the level of CD4 counts (immune system) and the other was for Viral Load (the amount of virus in the body). For CD4 readings a normal range is 800 – 1200 cells/ml. The level below the 800 cells/ml indicates a weak immune system. The measuring device for Viral Load works within the range of 50 – 5000 counts/ml. The lower the number, the lesser is the level of the virus in the body, and the lesser it worsens the health condition. Patient #1, Mr. Sa-ad: The **CD4** counts increased **from 2 to 840** after 11 months of consumption of MRET activated water and **Viral Load** was **less than 50**. Patient #2, Mr. Un-ruang: The **CD4** counts increased **from 90 to 805** after 3 months of consumption of MRET activated water and **Viral Load** was also **less than 50**.

A 61 years old nurse, name T.C., was diagnosed with **Myocardial Infarction** for 20 years. She was treated by cardiologist in the public hospital. In spite of the treatment she suffered from continuous short period heart attacks and had to take prescription medication every day. She started drinking MRET water in her daily life (the same volume as the ordinary water) since 20th April, 2004. Within 2 months of drinking MRET water she stopped suffering from heart attacks. She went back to see her doctor. The doctor indicated that she recovered from Myocardial Infarction and she was discharged from the Cardiac Clinic.

A male patient, name N.P., 65 years old was diagnosed with **Parkinson's disease** for 8 years. All the time he was treated by neurologist. His symptoms were: difficulty in walking, trembling hands, masking face, no reaction to impulses, could not speak loud and had no interest to life. After he drank MRET water for a couple of weeks there were significant improvements: he could walk longer steps, spoke louder and more clearly, smiled easily and did not show signs of stress on his face. In a couple of months he could stroll along 2 kilometers of the pathway at Mt. Khao Hin-ngam, Chaiyaphum province.

A male patient Y.S., 53 years old was diagnosed **Psoriasis** since he was a young boy and was treated by doctors in three medical school hospitals. He had the red spots on his face, ears, head and the body to the feet. His nails on every finger became shorter and shorter. However, after he drank **1.5 liters** of MRET activated water per day for a week, he found that his symptom of itchiness disappeared, the papule improved and the red spots paled. After he drank MRET water continuously for 2 months 30% of red spots looked like slight Hyper-pigmentation and he could stop the prescription medicine.

A female patient B.P., 37 years old was diagnosed with **terminal AIDS, lung tuberculosis, active PCP (consumer of hallucinogenic drug) and also Psoriasis** all over her body. Her symptoms were: the low fever in the afternoon and the evening, loss of appetite, look sick and pale, red face and red spots on the skin, having white scales on the body and feeling itchy all the time. She drank **1.5 liters** of MRET activated water per day since 13th July, 2004. In a week the symptom of itchiness disappeared, 40% of red spots looked like Hyper-pigmentation, her face looked fresher than before, she had no fever and showed more self-confidence.
